

## Class Objectives

-What is consciousness?

- What are the stages of sleep?
- How does sleep deprivation effect us?

## Consciousness is a state of awareness and responsiveness to:

$\qquad$

- Your own mental processes and inner awareness

## Dual Processing

- Perception, memory, thinking, language, and attitudes $\qquad$
The conscious (deliberate)
The unconscious (automatic)
- Through dual processing, we are
$\qquad$

## Inattentional

 Blindness- Inattentional blindness refers to the inability to see an object or a person in our midst.

Simons \& Chabris (1999) showed that half of the observers failed to see the

## Did you know?

- We spend about I/3 of our lives asleep. If you live to be 75 years old you will have slept about 25 years!
- An average 20 year old student has spent about 6 years asleep!
- Teens need at least
hours of sleep each
night, compared to an average of seven to nine hours each night for most adults.
- Their internal biological clocks also keep them awake later in the evening and keep them

$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
Do we sleep more if we are
physically active?
THINK

## Biological Clock

- Humans and other animals have an internal biological clock called the $\qquad$
$\qquad$
$\qquad$
$\qquad$
$\qquad$
Sleep and wakefulness
Blood pressure

## The Brain's Control of Circadian Rhythms

- Light triggers the suprachiasmatic nucleus to decrease (morning) melatonin from the pineal gland and increase (evening) it at nightfall.

$\qquad$
$\qquad$
$\qquad$
$\qquad$

## Isn't sleep all the same?

- No, the use of the EEG shows variations in brain waves which determine different stages of sleep.
- $\qquad$
- During an 8 hour period, people typically progress through all 5 full cycles,

Each cycle lasts about $\qquad$

## Non REM Sleep

## - NREM

$\qquad$ ) $\qquad$
sleep involves increasing

- Slower EEG activity occurs
- The heart rate and respiration are slower during NREM $\qquad$
$\qquad$
- People become more difficult to awaken as they progress through the four stages of NREM sleep.

## REM Sleep

- Rapid eye movement (REM) is also known as
- REM is difficult to distinguish from being awake on the basis of physiological measures

## Function of REM Sleep

- Memory storage- $\qquad$
$\qquad$
- Brain areas that are active during the learning of the task become active again during sleep
- Performance on tasks usually improves if you test someone a day after they've learned the task

As long as they get at least 6 hours of sleep

## Sleep Deprivation

- The longer people go without sleep - the
- A fatigued, sleep deprived person may experience:

Tendency to make mistakes
Irritability
A depressed immune system

- Greater vulnerability to accidents
.

## Sleep Deprivation

- Research on total sleep deprivation with humans is not possible
- However, rats totally deprived of sleep die
- lose inability to regulate body temperature - lose weight

What's Next...?
Sleep Disorders
