Cardiovascular System I: The Heart Chapter 17

CV system = _____

[heart *pumps* blood into blood vessels throughout the body]

Module 17.1 Overview of the Heart

LOCATION & STRUCTURE OF THE HEART
 Heart
 cone-shaped organ
 located slightly to left side in thoracic cavity
 (______)
 rests on diaphragm
 _____: inferior aspect
 ~ 250 to 350 grams (< 1 lb.)

Chambers and external anatomical features:

Chambers – RA and LA atria (atrium)

RV and LV ventricles

____ sulcus

- external indentation between the atria and ventricles

_____ sulcus

- external depression between RV and LV

Veins - carry blood _____

Arteries carry blood _____

• **Great vessels** = main veins and arteries that bring blood to and from heart [SVC, IVC, pulmonary V., pulmonary A., aorta]

PULMONARY & SYSTEMIC CIRCUITS

Pulmonary Circuit:

• Right side of heart (**pulmonary pump**) pumps blood to lungs

– ______ deliver oxygen-poor (deoxygenated) blood to lungs

- Gas exchange between alveoli and pulmonary capillaries

deliver oxygen-rich (oxvgenated) blood to left side of heart Systemic Circuit: Systemic pump (left side of heart) - *receives* blood from pulmonary veins and *pumps* it to rest of body Systemic arteries pump oxygen-rich (_____) blood to all systems of body (not lungs) Gas exchange at systemic capillaries return oxygen-poor (deoxygenated) blood to RA - Pulmonary circuit -low-pressure circuit → Systemic circuit high-pressure circuit \rightarrow FUNCTIONS OF THE HEART Heart helps maintain BP (blood pressure) ______ of contraction influence BP and blood flow to organs > Atria produce hormone: atrial natriuretic peptide (ANP) - ANP _____ BP by decreasing Na+ retention in kidneys \rightarrow

– ANP_____BP by decreasing Na+ retention in kidneys → decr. osmotic H₂O reabsorption

Module 17.2 Heart Anatomy and Blood Flow Pathway

PERICARDIUM

Pericardium – membrane surrounding heart

- 1. Fibrous pericardium outermost layer
 - 2. Serous pericardium produces serous fluid

[pericardial cavity]

- Visceral pericardium- (aka_____)

—

Pericardial cavity

- contains serous fluid (pericardial fluid)
- acts as a _____

HEART WALL

- 1. Epicardium outmost layer
- 2. _____
 - middle muscle layer
 [What type of muscle??]
 - fibrous skeleton (dense irregular collagenous CT)
- 3. Endocardium innermost endothelial layer

Cardiac Tamponade

- Pericardial cavity fills with \underline{excess} fluid \rightarrow cardiac tamponade
- Causes:
- Fibrous pericardium strong but <u>not</u> very flexible, excess fluid in pericardial cavity *squeezes* heart; reduces filling of ventricles
- Treatment

CORONARY CIRCULATION

Coronary vessels (supply heart wall):

• Branch off ascending aorta:

≻ 1.____

→ post. interventricular (post. descending a.)
→ marginal branch

➤ 2. left coronary artery

→ _____→ ant. interventricular a. (left ant. descending) _____

 \rightarrow \rightarrow

- Great cardiac vein
- Small cardiac vein
 - Middle cardiac vein

Coronary artery disease (CAD)

- buildup of ______(fatty material) in coronary arteries
- <u>decreases</u> blood flow to myocardium \rightarrow _____
- Symptoms: angina pectoris
- leading cause of death worldwide

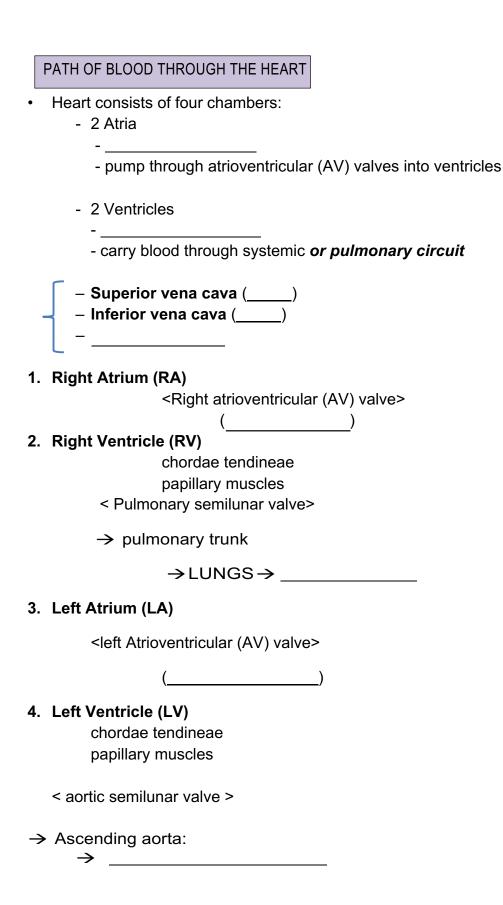

Myocardial infarction (MI) or heart attack

- Most dangerous potential consequence of CAD
- Occurs when ______
- Clot forms \rightarrow myocardial tissue infarct
- **Symptoms** include chest pain *radiates* to left arm shortness of breath, sweating, anxiety, and nausea and/or vomiting
- Women may present with ______
- Survival after MI depends on *extent* and *location* of damage
- Dead cells are replaced with _____
- Death of part of myocardium increases
- Risk factors include smoking, incr. BP, poorly controlled diabetes, high levels of certain lipids, obesity

_____ diagnostic test for CAD

Treatments

- modify *Lifestyle*
- medications
- then invasive treatments
- Coronary _____- balloon is *inflated* in blocked artery and ______inserted
- Coronary artery bypass grafting (CABG)
 - other vessels are grafted onto diseased coronary artery to bypass blockage

→ Aortic Arch

o <u>Brachiocephalic artery</u>	
o(LCC) artery	
o <i>artery</i>	
GREAT VESSELS, CHAMBERS, AND VALVES	
- Pectinate muscles – muscular ridges inside RA	
- Interatrial septum – wall between RA & LA	
 Fossa ovalis – indentation in interatrial septum; <i>remnant</i> of open (_) from fetal circulation 	ling
- Trabeculae carneae - ridged surface in Ventricles "beams of fles	sh"
RV –	
LV –	
LV wall = 3xthan RV	
HEART VALVES	
Tricuspid ()	
Pulmonary semilunar	
Bicuspid ()	
Aortic semilunar	
Pulmonary semilunar valve -	
Valvular Heart Diseases	
Diseases of heart valves	<i></i>
(present at birth) or	(infection, cancer, or
immune system disorder)	

- Two major types of valvular defects:
 - Insufficient valve
 - fails to close fully, blood leaks backward
 - _____ valve (narrowing)
 - calcium deposits \rightarrow hard and inflexible
- Both valve disorders may cause
- Symptoms: enlargement of heart, fatigue, dizziness, and heart palpitations
- Mitral and aortic valves are ones most commonly affected

Module 17.3 Cardiac Muscle Tissue Anatomy and Electrophysiology

ELECTROPHYSIOLOGY

- Cardiac muscle exhibits
- Cardiac muscle cells contract in response to electrical excitation in form of APs
- Cardiac muscle cells do <u>not</u> require stimulation from nervous system to generate APs
 - specialized cardiac muscle cells (=1% of cardiac muscle cells)
 - coordinate cardiac electrical activity

)

HISTOLOGY OF CARDIAC MUSCLE TISSUE AND CELLS

- Cardiac muscle cells
 - _

- generate tension through sliding-filament mech.

- Ex. of Structure-Function Core Principle
- Like skeletal muscle fibers, cardiac muscle cells contain selective
- Opening & closing action of these ion channels
 → both pacemaker & contractile cardiac APs

ELECTROPHYSIOLOGY OF CARDIAC MUSCLE

- Cardiac conduction system

 Pacemaker cells undergo rhythmic, spontaneous depolarizations → APs
 - Permits heart to contract as a *unit* and
- Sequence of events of *contractile cell AP resembles* that of *skeletal muscle fiber AP* with one exception:
 - Plateau phase *lengthens* cardiac AP → providing time required for heart to *fill* with blood;
 - also increases____;
 - _____ (sustained contraction) in heart by lengthening refractory period
 - Refractory period in cardiac muscle cells is so long that cells <u>cannot</u> maintain a sustained contraction
 - allows heart to ______before cardiac muscle

cells are stimulated to contract again

CARDIAC CONDUCTION SYSTEM

_ node (SA node)

- located in upper RA
- 60 to 100 bpm influenced by SNS & PSN

____ node (AV node)

- located near tricuspid valve
- 40 bpm
- AV node delay

Purkinje fiber system

- Purkinje fiber system:
 - Atrioventricular bundle (_____)
 - Right and left _____
 - Purkinje fibers
 - located in ventricular walls

ELECTROPHYSIOLOGY OF CARDIAC MUSCLE

AV node delay

- allows atria to depolarize (and *contract*) <u>before</u> ventricles, giving ventricles time to *fill* with blood
- also helps to prevent current from flowing *backward* from ______ into AV node and atria
- SA node = *main pacemaker* of heart
- Sinus rhythms = _____

Electrocardiogram (ECG)

- –_____in cardiac muscle cells over time
- electrodes placed on patient's skin (6 on chest, 2 on each leg)
- detects *disturbance* in electrical rhythm =_____or arrhythmia (= no rhythm)

- ECG represents depolarization or repolarization of parts of heart

P wave represents ______

- QRS complex represents ______
- T wave represents ______

What's missing??

Cardiac dysrhythmias have 3 basic patterns:

1. Disturbances in *heart rate (HR)*:

- _____ = HR < 60 bpm

- Tachycardia = HR > 100 bpm sinus tachycardia = regular, fast rhythm
 - 2. Disturbances in conduction pathways
 - disrupted by accessory pathways between upper & lower chambers or by _____

- Heart block at AV node;

P-R interval is <u>longer</u> than normal, due to incr. time for impulses to spread to ventricles through AV node; <u>extra P waves</u> are present, indicates that some APs from SA node are

not being conducted through AV node

- Right or left bundle branch block

- generally <u>widens</u> QRS complex due to depolarization taking longer to spread through ventricles
- 3. **Fibrillation** = electrical activity goes haywire → parts of heart to depolarize and contract while others are repolarizing and not contracting
 - bag of worms writhing

Atrial fibrillation

- generally <u>not</u> life threatening
- atrial contraction isn't necessary for ventricular filling
- ECG tracing "irregularly irregular" rhythm (one that has no discernible pattern) that lacks *P waves*

- Ventricular fibrillation

- <u>immediately</u> life-threatening
 - ECG exhibits chaotic activity
 - defibrillation (an electric shock to heart) depolarizes all ventricular
 muscle cells simultaneously
 - SA node will resume pacing heart after shock is delivered (ideally)
- "Flat-lining" = <u>asystole</u>
- defibrillation is not used for asystole because heart is not fibrillating and there is no electrical activity to reset
- instead, treated with CPR and pharmacological agents that stimulate heart such as atropine and Epi

Module 17.4 Mechanical Physiology of the Heart: The Cardiac Cycle

INTRODUCTION TO MECHANICAL PHYSIOLOGY

- Mechanical physiology actual processes by which blood *fills* and is pumped out of chambers
- Heartbeat =
- Cardiac cycle sequence of events that take place from one heartbeat to next (systole followed diastole for each chamber)

PRESSURE CHANGES, BLOOD FLOW, AND VALVE FUNCTION

Blood flows in response to *pressure gradients* (**Gradients Core Principle**); as ventricles contract and relax, pressure in chambers changes, causing blood to *push* on valves and open or close them:

- _____ (contraction phase)
 - Both of AV valves are forced shut by blood pushing against them
 - Both of semilunar valves are forced open by outgoing blood

(relaxation phase) –

Press. In ventricles falls below those in atria and in pulmonary trunk and aorta

→ forces AV valves open, _____

- → Higher pressures in pulmonary trunk and aorta push cusps of semilunar valves *closed*
- Stethoscope used to listen to (auscultate) rhythmic heart sounds:
 - **S1** ("lub") = _____
 - **S2** ("dub")=_____

Heart Murmurs and Extra Heart Sounds

- **Heart murmur** *turbulent* blood flow through heart often due to *defective valves*, defective chordae tendineae, or holes in interatrial or interventricular septum
- Cardiac cycle =
- Cycle is divided into four main phases that are defined by actions of ventricles and positions of valves: **filling**, **contraction**, **ejection**, and **relaxation**

1. Ventricular filling phase of cardiac cycle

- blood drains
- Pressures in LV and RV are lower than in atria, pulmonary trunk, and aorta
 - Higher pressures in pulmonary trunk and aorta cause semilunar valves to be closed; prevents backflow of blood into ventricles

Module 17.5 Cardiac Output and Regulation

INTRODUCTION TO CARDIAC OUTPUT AND REGULATION

Heart rate (HR)

= 60–80 cardiac cycles or bpm

Stroke volume

= ~70 ml/beat (amt. of blood ejected from each_____in a beat) Cardiac output (CO)

=_____into pulmonary & systemic circuits _____

DETERMINATION OF CARDIAC OUTPUT

• C.O. = heart rate x stroke volume:

 72 beats/min × 70 ml/beat = 5040 ml/min ~5 liters/min (C.O.)
 Resting C.O. ~ averages about 5 liters/min; RV pumps ~ 5 liters into pulmonary circuit LV pumps <u>same</u> *amt.* to systemic circuit

Normal adult blood volume = ~ 5 liters [:._____

FACTORS THAT INFLUENCE STROKE VOLUME

Frank-Starling law

- Increased ventricular muscle cells stretch, leads to →
- Ensures that vol. of blood discharged from heart is equal to vol. that enters it
- Important during exercise, when C.O. must increase to meet body's needs

Ventricular Hypertrophy

FACTORSTHATINFLUENCEHEARTRATE

- HR due to rate at which SA node generates APs
- _____ at which SA node depolarizes = chronotropic agents
 - Positive chronotropic agents
 - SNS, some hormones, increased body temp.
 - *Negative chronotropic agents*
 - PSN, decreased body temperature

REGULATION OF CARDIAC OUTPUT

Heart is autorhythmic but still requires *regulation* to ensure C.O. meets body's needs at all times

Regulated by _____(ANS) and _____systems

SNS (NEpi) \rightarrow HR, force of contraction

1

 $PSN(ACh) \rightarrow HR$, ______ force of contraction

______ – affected by SNS → Epi and NEpi - thyroid hormone and glucagon

Aldosterone and antidiuretic hormone increase blood vol. → incr. C.O.
 ANP decreases blood vol. → reduces C.O.

- Other factors that influence cardiac output:
 - [Electrolyte] in ECF
 - SA node fires more *rapidly* at higher body temp. and more *slowly* at lower body temp.

– Age

- Exercise

HEART FAILURE

- Heart failure (formerly CHF) = any condition that <u>reduces</u> heart's ability to pump *effectively*:
- and/or M.I, valvular heart diseases, any disease of heart muscle (cardiomyopathy) and electrolyte imbalances
- Heart failure \rightarrow <u>decreased</u> SV \rightarrow _____
- Signs and symptoms of heart failure depend on *type* of heart failure and *side* of heart that is affected

- LV failure, blood often backs up within pulmonary circuit; known as **pulmonary** congestion → _____

• Both RV and LV failure → peripheral edema, in which blood *backs up* in systemic capillaries (systemic congestion)

– _____ in legs and feet

- Peripheral edema exacerbated by kidneys retain excess fluid

- Treatment increase cardiac output
 - Lifestyle modifications -weight loss and mild exercise, dietary sodium and fluid restrictions
 - Drug therapy
 - Heart transplant and/or pacemaker

Cardiovascular System II: The Blood Vessels Chapter 18

Vasculature =_____60,000 miles of vessels Capillaries alone would circle the world (25,000 miles)

Module 18.1 Overview of Arteries and Veins

INTRODUCTION TO THE VASCULATURE

Blood vessels

- Transport blood to *tissues* (gases, nutrients, and wastes are exchanged) and back to *heart*

- _____to tissues

- Secrete a variety of chemicals

- ______ transports blood between heart (RV) and ______
- Systemic circuit transports blood between heart (LV) and ______
- Coronary circuit: circulation of blood to ______

(coronary arteries & veins)

3 types of vessels

1. Arteries

- distribution system of vasculature

-

2. Capillaries

- exchange system of vasculature
- smallest vessels
- -

3. Veins

- collection system of vasculature

-

- 3 basic layers or tunics of vessel wall:
 - ≻ Tunica intima
 - innermost layer
 - ≻ Tunica media
 - middle layer
 - _____ (VC and VD) and elastic fibers
 - > Tunica externa (adventitia)
 - Vaso vasorum

STRUCTURE AND FUNCTION OF ARTERIES AND VEINS

- Artery vs vein:
 - o Arteries
 - _____ → reflects arteries' role in controlling BP and blood flow
 - more extensive internal and external elastic → reflects arteries

are under much higher press.

•3 classes of arteries

➤ 1. _____ (conducting) arteries

- aorta and immediate branches
- highest pressure

≻ 2.____(distributing) arteries

- well dev. tunica media of SMC
- smaller diameter (named branches to organs)
- ≻ 3._____
 - smallest diameter
 - thin tunica media (1-3 layers of SMC)

Arterioles

– ______ = smallest arterioles that <u>directly</u> feed capillary beds

- precapillary sphincter SMC that encircles metarteriole-capillary junc.

Certain arteries monitor pressure and chemicals:

Baroreceptors -

Chemoreceptors -

- Veins
 - outnumber arteries
 - larger lumens
 - serve ______ (70% of total blood located in veins (systemic &

pulmonary veins)

- fewer elastic fibers
- less SMC

-

- Veins classified by size:
 - Venules <u>smallest</u> veins; *drain* blood from capillary beds
 - 3 tunics become more *distinct* as venules *merge* → larger venules → veins
 - thin tunica media
 - _____ prevent backflow of blood

Atherosclerosis

- Atherosclerosis leading cause of death in developed world; characterized by formation of atherosclerotic plaques (buildups of lipids, cholesterol, calcium salts, and cellular debris within arterial tunica intima)
- Plaques tend to form at branching points where blood undergoes sudden <u>changes</u> in *velocity* and *direction*
- Plaques form due to endothelial injury
- Vessel wall becomes inflamed, which attracts **phagocytes** to "clean up" area → damage to blood vessel → plaque formation
- SMC proliferation → secrete ECM
- Clot may form → MI or stroke
- 10% of world pop. may have Atherosclerosis
- •

```
Treatment:
```

Module 18.2 Physiology of Blood Flow

INTRODUCTION TO HEMODYNAMICS

Hemodynamics – physiology of blood flow

 Heart provides force that drives blood through blood vessels by creating a pressure gradient

(ex. of Gradients Core Principle)

- Pressure is highest near
- Blood flows *down* pressure gradient from area of higher P (near heart) to area of lower P (in peripheral vasculature)
- Blood pressure (mmHg) outward force that blood exerts on walls of blood vessels
 - ≻ Varies

→ _____ in large systemic arteries and

→_____in large systemic veins

Blood flow (vol. of blood/min) determined by:

- 1. <u>Magnitude</u> of ______
 - Generally, blood flow matches C.O. (avg. ~ 5–6 L/min)
 - Blood flow *directly proportional* to pressure gradient, (blood flow<u>increases</u> when pressure gradient <u>incr</u>.)
- 2.____(R) = any impedance to blood flow
 Blood flow inversely proportional to R
- 3._____related to X-sec. area
 - incr. branching \rightarrow incr. total x-sec. area
 - fastest in aorta, slowest in capillaries

FACTORSTHATDETERMINEBLOODPRESSURE

- BP influenced by 3 main factors:
 - 1. ____(PR)
 - any factor that *hinders* blood flow
 - PR is greatest further away from heart
 - as PR increases, BP increases
 - vessel radius, viscosity, vessel length
 - 2. _____ = SV x HR
 - 3. _____ influenced by water loss and gain

BP IN DIFFERENT PORTIONS OF CIRCULATION

- Pulmonary circuit ~ 15 mmHg
- Systemic circuit ~ 95 mm Hg (Fig. 18.5, 18.6; Table 18.2)

_____ pressure averages ~ 120 mm Hg

_____ pressure averages ~80 mm Hg (at rest)

Pulse pressure = systolic - diastolic pressures

= ~ 40 mm Hg

MAP = diastolic pressure + 1/3 (pulse pressure)

- Increase venous return:
 - _____ prevent backward flow
 - _____ in vein walls VC by SNS
 - Respiratory pump (difference in P between abdominal & thoracic cavity)

Varicose Veins

- Varicose veins
 - characterized by dilated, bulging, hardened veins
 - located in superficial veins of lower limb
- Hemorrhoids

High pressure in abdominopelvic cavity during defecation or childbirth <u>decreases</u> *return* of venous blood from anal veins; also superficial and not well supported by surrounding tissues, and thus may *weaken* and *dilate* because of high pressure

Module 18.3 Maintenance of Blood Pressure

Neural and Hormonal Control

1. _____

 $SNS \rightarrow _$ $\rightarrow VC \rightarrow _BP$

PSN \rightarrow _____ \rightarrow decr. C. O. \rightarrow _BP (CN X \rightarrow SA node, AV node)

Baroreceptor reflex:

_____ >

 \rightarrow via CN IX to medulla oblongata

→ PSN response = decr. BP or SNS response = incr. BP

Valsalva maneuver

1.

- Subject bears down and tries to expire against a <u>closed</u> glottis (airway in larynx), as occurs during coughing, sneezing, defecation, and heavy lifting
- o Raises pressure in thoracic cavity and reduces return of venous blood to heart
- → drop in *BP*; should trigger baroreceptor reflex and generate increased HR

- Effects of chemoreceptor stimulation:

- Peripheral chemoreceptors play a role in reg. *breathing*, but also affect BP; receptors respond to _____
- Central chemoreceptors respond to <u>decreases</u>; triggers another feedback loop that <u>indirectly</u> increases SNS; → VC and BP
 - responses are much slower
 - Hormones that control _

Epi, NEpi, thyroid hormone

- 2. Hormones that control ____
 - Adrenal medulla \rightarrow Epi, NEpi \rightarrow VC
 - Atria \rightarrow ANP \rightarrow VD
 - Angiotensin II \rightarrow VC

3. Hormones that reg. _____ Kidneys \rightarrow Renin \rightarrow Angiotensin II \rightarrow adosterone \rightarrow conserve H₂O \rightarrow ADH \rightarrow conserve H₂O

DISORDERS OF BLOOD PRESSURE

- Essential (primary) hypertension cause is unknown
- Secondary hypertension cause can be determined
- Hypotension systolic pressure < 90 mm Hg and/or
 - diastolic pressure < 60 mm Hg

• Circulatory shock = severe hypotension

- due to hypovolemia

Module 18.4 Capillaries and Tissue Perfusion

CAPILLARY STRUCTURE AND FUNCTION

Capillary Exchange via:

- 1. Diffusion & osmosis
- 2. Diffusion
- 3. Transcytosis
- Types of capillaries
 - _____ skin, nervous, CT, muscle
 - Most capillaries
 - Fenestrated capillaries kidneys, endocrine, S.I.
 - _____ liver, lymphoid

BLOOD FLOW THROUGH CAPILLARY BEDS

When precapillary sphincters are open:

When precapillary sphincters are closed:

LOCAL REGULATION OF TISSUE PERFUSION

- Autoregulation (self-regulation)
 - ensures that correct amount of blood is delivered to match a tissue's *level of activity*
 - ~ 25% of body's capillary beds are <u>fully</u> open

Module 18.5 Capillary Pressures and Water Movement

PRESSURES AT WORK IN A CAPILLARY

_____ drives movement of water across cap. wall (passive process)

Pressures at work across capillary bed:

_____ (*HP*) moves water out of cap.

- 35 mmHg (arterial end) → 15 mmHg (venule end)
 - _____ (**OP**) draws fluid into cap.
 - 25 mmHg throughout cap. bed
- Hydrostatic pressure –
- - Solute particles in a solution exert a force, or "pull," on water molecules

called osmotic pressure (OP)

- Osmotic pressure is determined by _____
- OP of capillary blood = 25 mmHg
 - Plasma proteins pull fluid into cap.
- OP of interstitial fluid = 3 mmHg
 - Proteins in interstium pull fluid out of cap.

25 - 3 = **22mmHg**

• Capillary net filtration pressure (NFP)

- colloid OP and HP gradient drive water in opposite directions

_____ (NFP)

HP - COP = NFP

At arteriolar end:

- 35 mm Hg 22 mmHg = _____ (out of cap.) At venule end:
 - 15 mmHg 22 mmHg = ____(into cap.)
- NFP is not exactly even at 2 ends of cap. bed
 - overall NFP favors filtration of water out of capillary
- Excess fluid in interstitium returned to blood
- Edema =

Causes:

- increase in CHP gradient due to HT
- decrease in COP due to liver disease, cancer, or starvation
- Peripheral edema in hands and feet due to gravity
- Ascites accumulation of interstitial fluid in abdomen

Module 18.6 Anatomy of the Systemic Arteries

ANATOMY OF THE SYSTEMIC ARTERIES

Aorta (4 sections)

1. Ascending aorta

- Rt & Lt coronary arteries

- 2. Aortic arch
 - -
- 3. Descending thoracic aorta

4. Descending abdominal aorta

-Rt and Lt common iliac A.

Cerebrovascular Accident

- Cerebrovascular accident (CVA), or stroke
 - damage to brain caused by a disruption to blood flow
 - 4th most common cause of death (US)
- Causes
 - (1) blockage of cerebral arteries due to a clot
 - (2) loss of blood (hemorrhage) due to ruptured cerebral artery
- Symptoms
 - sudden-onset paralysis (paresis or weakness)
 - loss of vision,
 - difficulty speaking or understanding speech
 - Headache
- Risk factors

- -
- -
- _

Treatment

- medications to dissolve clot and thin blood
- surgery to repair damaged vessels

PULSE POINTS

- **Pulse** = Pressure changes cause arteries to *expand* and *recoil* with each heartbeat
 - _

- Pulse points

Module 18.7 Anatomy of the Systemic Veins

INTRODUCTION TO THE SYSTEMIC VEINS

Systemic veins carry _____

Superior to diaphragm:

Blood draining *lower limbs* and *pelvis:* → **external and internal iliac veins** merge to form **common iliac veins** → merge to form_____→ **RA**

VEINSOFTHEHEADANDNECK

Head and neck:

- internal jugular veins
- external jugular veins

VEINSOFTHETHORAXANDABDOMEN

- Hepatic portal circulation:
 - Drains nutrient- rich, oxygen-poor blood from digestive organs
 - Superior and inferior mesenteric veins

→_____

Liver then detoxifies substances including drugs

- blood then goes to IVC

Blood:

Chapter 19

Blood = 5 L. of fluid CT, 8% TBW comprised of

Module 19.1 Overview of Blood

BLOOD OVERVIEW

- Plasma ____ECM of blood
- Formed elements -____suspended in plasma
 - _____ also known as red blood cells (RBCs)
 - _____ also known as white blood cells (WBCs)
 - ______ small cellular fragments (thrombocytes)
 - Centrifuged blood sample
 - <u>Top layer</u> **plasma**
 - Middle layer leukocytes and platelets (buffy coat)
 - Bottom layer erythrocytes
 - hematocrit =

OVERVIEW OF BLOOD FUNCTIONS

Functions:

- Exchanging gases O₂ and CO₂
- transports ions, nutrients, hormones, and wastes, and regulating [ions]
- Immune functions both *leukocytes* and immune system *proteins* are transported in blood
- _____

_____ – platelets

- Acid-Base balance: 7.35 7.45 pH
- BP: determined by blood vol.

PLASMA

- Plasma
 - Pale yellow liquid
 - 90% water, determining viscosity

_____ (9% of plasma vol.)

Albumins (COP)

Immune & Transport (Gamma globulins, lipoproteins)

Clotting (Fibrinogen)

Other Solutes: glucose, a.a., gases, wastes

- Liver disease (cirrhosis) has many causes, including cancer, alcoholism, and viral hepatitis
- Common in US; 10th leading cause of death for men; 12th for women
- Results in progressive <u>decrease</u> in *production of plasma proteins*; leads to decreased_____; results in fluid loss to extracellular spaces, producing *severe edema* in the abdomen; termed ______
- Decline in _____levels also causes easy bruising and delays clotting; may be fatal

Module 19.2 Erythrocytes and Oxygen Transport

ERYTHROCYTE STRUCTURE

Erythrocyte, or red blood cell (RBC)

- anucleated, more space for O2-binding

- Hemoglobin (Hb)
 - 2 alpha (a) chains and 2 beta (b) chains
 - heme group = _____
 - Fe ion in each heme group is *oxidized* when it *binds to oxygen* → ______

Hemoglobin :

- Releases oxygen into tissues where oxygen conc. is low
 - Binds to $CO_2 \rightarrow$ where oxygen levels low

ERYTHROCYTE LIFESPAN

- Life span of an erythrocyte:
- Hematopoiesis process in red bone marrow where *formed elements* in blood are produced by hematopoietic stem cells (HSCs)
- Erythropoiesis produces erythrocytes from HSCs

ERYTHROPOIESIS

-

- Regulation of Erythropoiesis
 - –____(EPO) triggers neg. feedback
 - maintains hematocrit within normal
 - Stimulus: Blood levels of oxygen fall below normal
 - Receptor: Kidney cells detect falling oxygen levels
 - Control center: Kidneys produce more EPO
 - Effector/Response: RBC production increases

Homeostasis:

ERYTHROCYTE DEATH

- Erythrocyte destruction:
- 1. Erythrocytes trapped in sinusoids of _____
- 2. Spleen macrophages digest erythrocytes
- 3. Hemoglobin is broken down into a.a, Fe, and (biliverdin \rightarrow) bilirubin
 - 4a. Bilirubin → _____

4b. Fe and a.a. recycled \rightarrow _____

ANEMIA

Anemia =

Causes: <u>decreased</u> *Hb*, <u>decreased</u> *Hct*, and <u>abnormal</u> *Hb Symptoms: pallor, weakness, fatigue, incr. HR Types*: Iron-deficiency anemia (decr. Hb) Pernicious anemia (decr. Hct) SCA (abnormal Hb)

Abnormal hemoglobin

- most common ex. sickle-cell disease (SCD)
- Individuals with single copy of defective gene have ______
- Individuals with two defective copies of gene have sickle-cell disease;
- produce abnormal hemoglobin called hemoglobin S (HbS)

• Abnormal hemoglobin (continued):

 When oxygen levels are low, RBCs containing HbS change into a sickle shape; leads to erythrocyte destruction in small blood vessels and a reduction in circulating erythrocytes

Module 19.3 Leukocytes and Immune Function

LEUKOCYTES

- Leukocytes or white blood cells (WBCs)
 - larger than erythrocytes
 - nucleated
 - use blood-stream as transportation only

Two basic categories:

- _____ contain cytoplasmic granules
- Agranulocytes ______

GRANULOCYTES

- Granulocytes
 - readily distinguished by their unusual nucleus
 - 3 categories based on granule color
 - light lilac, dark purple, or red when stained with Me blue or acidic (eosin) dye

_____ 60-70%

Eosinophils <4%

Basophils <1%

- Neutrophils (PMNs)
 - most numerous leukocyte
 - light lilac color

- phagocytosis

- nucleus composed of _____
- Eosinophils
 - appear red due to uptake of eosin dye
 - Phagocytes that ingest foreign molecules
 - Respond to parasitic infections and *allergic* rxn.
 - Granules contain enz. specific to ______

- Basophils least numerous leukocyte
 - S-shaped nucleus and appear dark purple due to methylene blue dye
 - Chemicals in granules _____

AGRANULOCYTES

Agranulocytes

٠

Lymphocytes 20-25%

- 2nd most common leukocyte
- contain large, spherical nuclei and light blue rim of cytoplasm
- B lymphocytes (B cells)

- T lymphocytes (T cells)

•

•

Monocytes 3-8%

- largest leukocyte

- large U-shaped nuclei

- Some mature into ______
- Macrophages phagocytic cells that ingest dead and dying cells, bacteria, antigens, and other cellular debris

Complete Blood Count

- Complete Blood Count (CBC) important test for anemia and other conditions
- Blood sample is drawn and examined under the *microscope* and by an *automated analyzer* to evaluate number and characteristics of blood cells:

 - RBC characteristics size, volume, and concentration of hemoglobin in cytosol

- Platelet count and volume
- Numbers and types of leukocytes

LEUKOPOIESIS

- Leukopoiesis formation of WBCs from (HSCs):
 - Myeloid cell line produces <u>most</u> formed elements (RBCs, monocytes, and platelets)
 - Lymphoid cell line produces lymphoblasts, committed to becoming B and T lymphocytes

Leukemia

- Leukemias are cancers of blood cells or bone marrow;
 - Also classified by *cell line* from which abnormal cells derive:
 - Lymphocytic from lymphoid cell line; generally abnormal B lymphocytes
 - Myelogenous from myeloid cell line; can involve any of myeloid cells

Module 19.4 Platelets

PLATELETS

- Platelets
 - small cell fragments of megakaryocyte
 - involved in _____(stops blood loss from an injured blood vessel)
 - several types of granules: contain clotting factors, enzymes
 - Lifespan:

_

Module 19.5 Hemostasis

HEMOSTASIS

- Hemostasis forms blood clot to plug broken vessel
 - to limit significant blood loss
 - Part 1: Vascular Spasm
 - Part 2: Platelet Plug Formation
 - Part 3: Coagulation (Intrinsic and Extrinsic Pathway)
 - Part 4: Clot Retraction
 - Part 5: Thrombolysis

HEMOSTASIS – VASCULAR SPASM

- Hemostasis Part 1: Vascular Spasm begins immediately when a *blood vessel is injured* and blood leaks into ECF with following two responses:
 - ______ and increased *tissue pressure* both act to <u>decrease</u> *blood vessel diameter*
 - Blood loss is <u>minimized</u> as both *BP* and *blood flow* are reduced <u>locally</u> by these responses

HEMOSTASIS – PLATELET PLUG

HEMOSTASIS – COAGULATION

CONCEPT BOOST: Making Sense of the Coagulation Cascade

- What's the best way to approach the coagulation cascade? Remember that the entire process has three simple goals:
 - Produce factor Xa goal of both intrinsic and extrinsic pathways, activates prothrombin

- Produce thrombin produces enzyme thrombin
- Produce fibrin thrombin, in turn, accomplishes third goal of coagulation: producing fibrin to hold platelet plug together and seal wound

HEMOSTASIS – CLOT RETRACTION

HEMOSTASIS - THROMBOLYSIS

REGULATION OF CLOTTING

- Blood clotting is produced by a _____; example of Feedback Loops Core Principle; must be tightly regulated to prevent mishaps
 - – Endothelial cells → two chemicals that regulate 1st and 2nd stages of clot formation
 - Prostacyclin prostaglandin; <u>inhibits</u> platelet aggregation
 - Nitric oxide causes vasodilation
 - Endothelial cells and hepatocytes produce anticoagulants; inhibit coagulation:
 - Antithrombin III (AT-III) protein that binds and inhibits activity of both factor Xa and thrombin; also <u>prevents</u> activation of new thrombin
 - Heparin sulfate polysaccharide that enhances antithrombin activity
 - Protein C when activated by protein S, catalyzes reactions that degrade clotting factors Va and VIIIa

DISORDERS OF CLOTTING

- Clotting Disorders
- 1. Bleeding disorders:
- Hemophilias 2. Hypercoagulable conditions:
 - $\overline{\text{DVT}}$ (deep vein thrombosis) $\rightarrow \overline{\text{PE}}$ pulmonary embolism

Anticlot Medications

- Patients with thrombi or emboli are treated with drugs that prevent clotting process
- Anticoagulants widely used group of medications; manage and prevent emboli; include:
 - Heparin
 - Warfarin (Coumadin)
- Antiplatelet drugs:
 - Aspirin –
 - Clopidogrel -
- Thrombolytic agents (tPA or urokinase)

Module 19.6 Blood Typing and Matching

BLOOD TRANSFUSIONS

- Blood transfusions – blood taken from a donor is given to a recipient
 - Discovery of _____(surface marker) found on all cells, including RBCs; genetically determined CHO chain
 - Antigens on erythrocytes (genetically determined carbohydrate chains) give rise to different blood groups
 - Two groups of the 30 different antigens found on erythrocytes are particularly useful for clinical use:_____blood group and____blood group

_

BLOOD TYPING

ABO blood group features two antigens, A and B antigens; gives rise to four ABO types:

- Type A <u>only</u> is present on RBC
- Type B <u>only</u> is present
- Type AB both A and B antigens are present
- Type O <u>neither</u> antigens are present
- Rh blood group
- Rh antigen first discovered in rhesus monkeys; individuals with Rh antigen (D antigen)
- Rh-positive (Rh+) ______
- Rh-negative (Rh–) ______
- Type **O+** is most common blood type in U.S. populations while **AB** is least common
- Blood typing in the lab uses antibodies (agglutinins) that bind to antigens on RBCs
- Causes them to *clump together* or ______
- Ultimately, agglutination promotes ______
- •

BLOOD TRANSFUSIONS

- Note that *anti-A* and *anti-B antibodies* are *pre-formed*; they are present in plasma even if individual has <u>never</u> been *exposed to those antigens*
- Anti-Rh antibodies, however, are produced only if a person ______
- Therefore, an Rh- individual generally has <u>no</u> *anti-Rh antibodies* unless he or she has been *exposed* (sensitized) to *Rh*+ *erythrocytes*
- Antigens and antibodies are basis for blood matching; blood taken from a donor is screened for compatibility prior to its administration to a recipient
 - A match occurs if donor blood type is compatible with recipient blood type

 Transfusion reaction – recipient antibodies bind to donor antigens; causes agglutination that *destroys donor erythrocytes*, possibly leading to kidney failure and death

Hemolytic Disease of the Newborn (HDN)

- Also known as _____; occurs when an *Rh– mother* gives birth to an *Rh+ fetus*
- During birth *fetal RBCs enter mother's blood*; stimulates her immune system to produce *anti-Rh antibodies*
- First pregnancy is not typically at risk; in subsequent pregnancies maternal anti-Rh antibodies can cross placenta and *hemolyze* Rh+ *fetal RBCs*
- Effectively prevented with *blood type screening*; if woman is Rh–, can be given Rh
 (D) immune globulin; contains anti-Rh antibodies that *bind fetal cells in maternal circulation*; <u>prevents</u> maternal production of anti-Rh antibodies
- Universal donor Blood type_____
 - —
 - Can be given to any other blood type in an emergency when blood matching is not an option
- Universal recipient blood type _____
 - These individuals *do not make antibodies* to A, B, or Rh antigens
 - Individuals with AB+ blood type can generally receive blood from any blood type donors
 - Matching is still safest practice

The Lymphatic System and Immunity Chapter 20

Immune System =

Lymphatic System works with immune system

Module 20.1 Structure and Function of the Lymphatic System

INTRODUCTION TO THE IMMUNE AND LYMPHATIC SYSTEMS

- Lymphatic system
 - group of organs and tissues that work with immune system
 - functions _____
 - 2 main components:
 - Lymphatic vessels: blind-ended tubes
 - Lymphatic tissue and organs: tonsils, lymph nodes, _____

FUNCTIONS OF THE LYMPHATIC SYSTEM

- Lymphatic system functions:
 - 1. Regulation of _____
 - return excess fluid lost from plasma to CV system
 - 2. Absorption of _____
 - breakdown products of fats in diet are too *large* to pass into blood cap. (absorbed into_____)
 - 3. Immune functions
 - filter pathogens from lymph and blood

LYMPHATIC VESSELS AND LYMPH CIRCULATION

• Lymph-collecting vessels

→ lymph trunks → cisterna chyli

2 lymph ducts

Right lymphatic duct	Thoracic duct
----------------------	---------------

Right Subclavian Vein Left Subclavian Vein

Lymphatic vessels

low-pressure circuit because no main pump to drive lymph through vessels, and most of them are transporting lymph <u>against</u> gravity

– Valves _____

(swelling) is an accumulation of <u>excess</u> interstitial fluid; many conditions can cause mild to moderate edema, including trauma, vascular disease, and heart failure

- However, edema seen with lymphedema is typically severe and can be disfiguring
- Lymphedema is generally due to *removal* of lymphatic vessels during surgery or *blockage* of vessels from pathogens such as parasites
- Both conditions <u>prevent</u> lymphatic vessels from transporting excess interstitial fluid back to cardiovascular system; fluid therefore *accumulates* in tissues of affected body part, causing it to enlarge
- Photo shows a case of lymphedema in arm of a breast cancer patient resulting from surgical removal of lymph nodes

LYMPHOID TISSUES AND ORGANS

- Mucosa- Associated Lymphatic Tissue (MALT)
 - Tonsils (palatine, pharyngeal, lingual)
 - Peyer's patches (aggregated lymphoid nodules)
 - Appendix
- Lymph nodes
- Spleen
