Schizophrenia and Related Disorders

Chapter 6

Class Objectives

What is Schizophrenia?

What are the features of Schizophrenia?
- Positive symptoms
  - Hallucinations, delusions
- Negative symptoms

Stop and Think...
How would you describe Schizophrenia?

How would you describe a person with this disorder?
Schizophrenia comes from the Greek words for _______________________.

- Bleuler’s (1908) belief that underlying all the unusual behaviors was an _______________________.

This phrasing contributed to a large misconception about Schizophrenia. Cognition, emotion and perception are splintered, it is NOT multiple personality disorder!

History

Schizophrenia

The broad category of schizophrenia includes a set of disorders in which individuals experience distorted

______________________________

______________________________

______________________________

How disruptive is this disorder?

Schizophrenia is a devastating disorder that has a tremendous impact almost every area of functioning.

This disorder is characterized by a broad spectrum of cognitive and emotional dysfunctions, for a period of 1-month, including:

- Hallucinations
- Delusions
- _______________________

______________________________

______________________________

______________________________
Schizophrenia Spectrum

- Schizophrenia is now classified as a spectrum disorder rather than a single disease entity.
- Section 3 of the DSM-5 includes a set of symptom severity ratings.

Society tends to devalue and dehumanizes those with schizophrenia.

People with these severe mental disorders are

Are people with Schizophrenia accurately portrayed in our society?

THINK
Characters on TV and in movies, as well as images in the media commonly depict this disorder inaccurately and often promote

More than ________% of TV characters in prime-time dramas with schizophrenia are presented as violent.

More than 1/5 depicted as murders.

Symptoms of schizophrenia are divided into 2 categories:

- Positive symptoms:
  - __________________________

- Negative symptoms:
  - Indicate the __________ of normal behavior.
  - Researchers proposed that positive symptoms reflected activated dopamine levels in the nervous system and
    __________________________
Positive symptoms

- This symptom involves disorder of thought content and beliefs that are misrepresentations of reality.

- A person who believes the flickering street light is sending him messages from the aliens is delusional.

Hi, Jesus Christ... Nice to meet you.

- For example when you believe that you are very special or have special powers or abilities.

- “I'm Napoleon” “I can cure cancer with my powers”

Delusions

- Delusions of persecution (paranoid delusions) can be the most disturbing for people with schizophrenia.

- A very common delusion effecting 1/3 of people with schizophrenia.
Delusions of Reference

- They believe people on television or radio are talking about, or talking directly to them.
- They believe the headlines or stories in newspapers are written especially for them.
- They believe that events have been deliberately created for them, or have special personal significance.

Hallucinations are also positive symptoms of schizophrenia that are evidence of ____________________
Hallucinations are false perceptions and

- Causing people to hear, see, taste, touch or smell what others do not.

Understanding Hallucinations

- Research found by using SPECT scan of the brain that the

  - linked to speech production.

- This research suggests that people are not hearing the voices of others but they are listening to their own

  -

In contrast to the presentation of new features with positive symptoms, negative features of schizophrenia indicate the

  - They include emotional and social
Avolition (Apathy) is the inability to initiate/persist in important activities.

- ____________________________

Alogia is often referred to as ___________________.
This is the relative absence of typical speech

- A person with alogia may respond with brief answers to questions that have little content and may appear uninterested in the conversation.

- Example: “Do you have children?” “Yes”

Are they just unsocial people?

- This deficit in communication is believed to reflect a negative thought disorder, rather than inadequate communication skills.

- Research suggests that people with alogia may have ____________________________

Ha, ha…Mom’s dead!

- Sometimes people with schizophrenia display

- Behavior that does not fit the mood is sometimes displayed; such as laughing or crying at inappropriate times

- Laughing at a funeral
People with schizophrenia often lack insight (awareness) and ________ ________

- These are marked by looseness of associations, in which the patient rambles on from topic to topic in ________
  - Where unrelated answers are given to questions

Disorganized Thoughts

The “word salad” is also displayed in which the patient’s speech is so incoherent that it makes no ________
Physical characteristics

- Some people are very physically agitated—"psychomotor agitation"
- Others in the other extreme, hold unusual postures called ________________
- This can also involve the tendency to keep their bodies in the positions someone else puts them in

Course of Schizophrenia

- In the most serious cases, the individual experiences ______________________________________
- When the individual’s symptoms or her behavior and are below those required for a DSM diagnosis, the disorder is considered to be in Remission.
- The course and outcome for people with Schizophrenia are poorer as compared to other psychological disorders.
  - More recurrent episodes are likely during the first 10-15 years
  - Most continue to experience disorganized thinking and psychotic symptoms.
- If treatment is received during an active phase, over 40% can recover for one or more years at a time
  - Poorer cognitive skills, a longer period of time without treatment, substance abuse, a poorer course of early development, higher vulnerability to anxiety, and negative life events re some of the factors that contribute to poorer prognosis
  - Men are at high-risk if they possess these additional characteristics
Men are more likely than women to:

- Experience the negative symptoms
- Have poorer functions over time

When does this develop?

- This disorder affects men and women equally, but the disorder seems to appear at different times:
  - Later in women (usually in twenties and thirties)

Statistics on Schizophrenia

- Schizophrenia is a chronic and disabling brain disease that affects approximately 1% of the general population
  - about 2 million Americans each year (Ho et al., 2003).
- There is NO cure and even with treatment people with schizophrenia are likely to experience life-long difficulties.
- People with schizophrenia have a shorter life expectancy due to the higher rate of suicide and accidents (Ho et al., 2005).
For every three men who develop schizophrenia over the course of their lives, two women are affected with the disorder.

People with schizophrenia are two to three times more likely to die compared to others within their age group.

Current models propose that individuals have a biological pre-disposition, but only when certain environmental conditions are in place.

Brains of people with schizophrenia have enlarged ventricles which occur in people with schizophrenia alongside

Neurodevelopmental hypothesis proposes that schizophrenia is a disorder of development that arises during the years of adolescence or early adulthood due to alterations in the

Individuals having their first psychotic episodes have a number of inexplicable brain abnormalities as the result of the illness.
Family studies

Suggest that people do not inherit a predisposition for one type of schizophrenia, but rather a ____________ for schizophrenia that manifests in a particular form of schizophrenia.

Genetic Influences

- You have the greatest chance (____%) of having schizophrenia if your identical twin does.
- If both of your parents have schizophrenia you have a 46% chance of developing the disorder.

The biological risk of developing Schizophrenia
Other causes
Another theory suggests that there is some relationship between high levels of the and schizophrenia.

When drugs are administered that are known to increase dopamine there is an increase in schizophrenic behavior and vice versa.

Can Schizophrenia be Treated?
Neuroleptics (anti-psychotics) were help people with schizophrenia think more clearly and reduce or eliminate hallucinations and delusions by working on dopamine receptors areas in the brain.
- Reduce the positive symptoms but are less effective in controlling the negative and disorganized.

Antipsychotic Medications
First generation anti-psychotics produced serious side-effects which include motor difficulties similar to those experienced by patients with Parkinson’s disease.
- 

Second generation antipsychotics work on both produce less side-effects (Zyprexa, Risperdal, Seroquel).
- Approximately 50-70% of patients will show improvement to some degree.
Patients often fail to return to clinics and hospitals for follow-up, which make psychosocial interventions a necessity in treatment.

- Traditional therapy
- Behavioral family therapy
- Vocational rehabilitation
- Self-advocacy
- Psychosocial clubs

There are many treatments for this disorder, but because it is such a complex one treatment must be carried out at all levels.

-One approach alone is not sufficient to address the many needs of people with schizophrenia

Putting it all together
